

# APPLICATION NOTE

ONLine Access

Set up EWSi controller in order to give access to readers once per day

A039

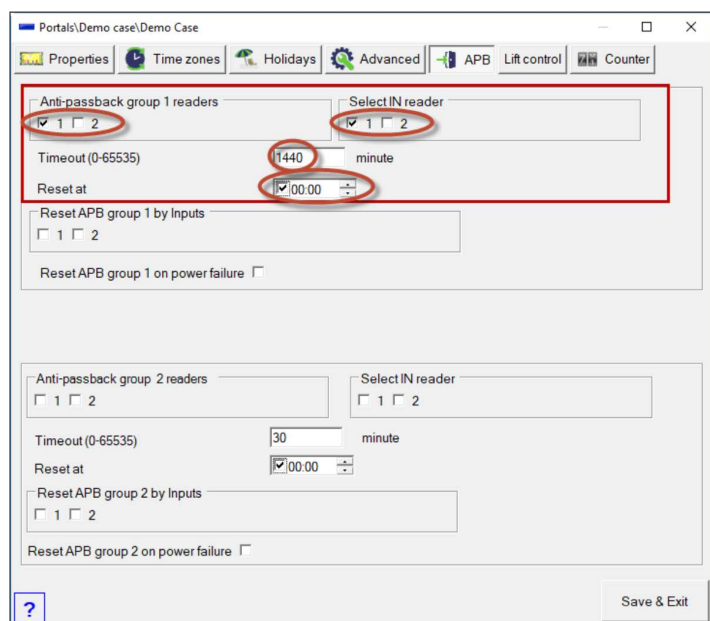

## ONCE PER DAY ON ONE DOOR USING NORMAL ANTI-PASSBACK

1. Right click on the Controller and select "Properties"

- Go to "APB" Tab and select as in the picture. First, select that only one reader will be in Anti-Passback, then select that it will be IN reader.

Put RESET time at midnight. Put Timeout at 1440 minutes (24 hours) or at 0 minutes (no timeout at all).

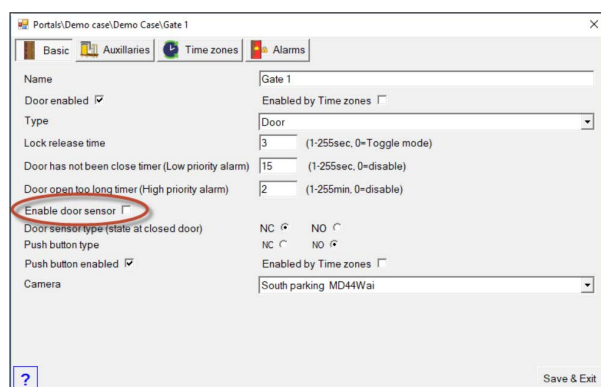

Once the user passes the card at reader 1, he can not pass the same card up until after midnight or after 1440 minutes.

### NOTE:

If you don't use Door Sensors, then the door sensors in "DOOR" should be disabled.

Right click on the DOOR/Properties.

APB can work with or without door sensors. If it is with door sensors, then the APB is guided by the door sensor (if the door is physically open or not). If you don't use door sensors, then the APB is guided by the card punch itself.
